

ABSTRACT

The MOBILEHUB is a mobile store operation by automating sales, purchases, and customer interactions. It offers a centralized platform for mobile shop owners to efficiently handle inventory, sales tracking, stock monitoring, and customer records. Product details and prices are stored in the database, with the system allowing the administrator to manage client details, accept or reject clients, and update product prices. Sales are conducted based on the latest product prices recorded. The system generates various reports including mobile product details, manufacturer information, sales, and purchases. Additionally, it facilitates customer access to service providers for mobile-related services, enabling bookings through the system.
